| Question 3<br>Correct<br>Marked out of<br>7.00 | The problem solvers have found a new Island for coding and named it as Philaland. These smart people were given a task to make a purchase of items at the Island easier by distributing various coins with different values. Manish has come up with a solution that if we make coins category starting from \$1 till the maximum price of the item present on Island, then we can purchase any item easily. He added the following example to prove his point. |
|--|---|
| F Flag question                                | Let's suppose the maximum price of an item is 5\$ then we can make coins of (\$1, \$2, \$3, \$4, \$5] to purchase any item ranging from \$1 till \$5.   |
|  | Now Manisha, being a keen observer suggested that we could actually minimize the number of coins required and gave following distribution (\$1, \$2, \$3). According to him any item can be purchased one time ranging from \$1 to \$5. Everyone was impressed with both of them. Your task is to help Manisha come up with a minimum number of denominations for any arbitrary max price in Philaland.   |
|  | Input Format  |
|  | Contains an integer N denoting the maximum price of the item present on Philaland.  |

# **Output Format**

Print a single line denoting the minimum number of denominations of coins required.

# Constraints

- 1<=T<=100
- 1<=N<=5000

# Refer the sample output for formatting

**Activate Windows** Sample Input 1: Go to Settings to activate Wind 10

| Sample Output 1:   |
|--|
| <b>.</b>   |
| Sample Input 2:  |
| 5  |
| Sample Output 2:   |
| 3  |
|  |
| Explanation:   |
| For test case 1, N=10.   |
| According to Manish (\$1, \$2, \$3, \$10) must be distributed.   |
| But as per Manisha only (\$1, \$2, \$3, \$4) coins are enough to purchase any item ranging from \$1 to \$10. Hence minimum is 4. Likewise denominations could also be (\$1, \$2, \$3, \$5). Hence answer is still 4, |
| For test case 2, N=5.  |
| According to Manish (\$1, \$2, \$3, \$4, \$5) must be distributed.  Activate Windows   |

But as per Manisha only (\$1, \$2, \$3) coins are enough to purchase any item ranging from \$1 to \$5. Hence minimum is 3, Likewise, denominations could also be (\$1, \$2, \$4).

Go to Settings to activate Windo

Hence answer is still 3.

Question 3 Correct 7.00

Marked out of P Rag guestion

Here's an illustration:

2+3+4=9 1+3+4=8 1+2+4=7

It has the following:

Constraints

. 1 sn s 2 x 100

1 sk s 4 × 1015

n an integer that denotes the number of food items & an integer that denotes the unhealthy number

all items have a value associated with them. An item's value is the same as the number of macronutrients it has. For example, food item with value 1 has 1 macronutrient, food item with value 2 has 2 macronutrients, and incrementing in this fashion.

Hence, one of the three needs to be skipped. Thus, the best combination is from among:

Since 2 + 3 + 4 = 9, allows for maximum number of macronutrients, 9 is the right answer.

Complete the code in the editor below. It must return an integer that represents the maximum total of macronutrients, modulo 1000000007 (10° + 7).

The nutritionist has to recommend the best combination to patients, i.e. maximum total of macronutrients. However, the nutritionist must avoid prescribing a particular sum

A nutritionist is labeling all the best power foods in the market. Every food item arranged in a single line, will have a value beginning from 1 and increasing by 1 for each, until

of macronutrients (an 'unhearthy' number), and this sum is known. The nutritionist chooses food items in the increasing order of their value. Compute the highest total of macronutrients that can be prescribed to a patient, without the sum matching the given 'unhealthy' number.

Given 4 food items (hence value: 1,2,3 and 4), and the unhealthy sum being 6 macronutrients, on choosing items 1, 2, 3 -> the sum is 6, which matches the 'unhealthy' sum.

Go to Settings to activate Windo

Activate Windows

Input Format For Custom Testing The first line contains an integer, n, that denotes the number of food items. The second line contains an integer, k, that denotes the unhealthy number. Sample Input 0 2 Sample Output 0 3 Explanation 0 The following sequence of n = 2 food items: 1. Item 1 has 1 macronutrients. 1 + 2 = 3; observe that this is the max total, and having avoided having exactly k = 2 macronutrients. Sample Input 1 Act

Got

| Sample Output 1  |
|--|
| 2  |
| Explanation 1  |
| <ol> <li>Cannot use item 1 because k = 1 and sum ■ k has to be avoided at any time.</li> </ol> |
| 2. Hence, max total is achieved by $sum = 0 + 2 = 2$ .   |
| Sample Case 2  |
| Sample Input For Custom Testing  |
| Sample Input 2   |
| 3  |
| 3  |
| Sample Output 2  |
| 5  |
| Explanation 2  |

2 + 3 = 5, is the best case for maximum nutrients.

Answer: (penalty regime: 0 %)

```
1 |#include <stdio.h>
    int main()
 2
 3 . {
        long long int n,t,i,nut=0;
scanf("%lld %lld",&n,&t);
 5
 6
         for(i=1;i<=n;i++)
 7 .
